New human anti-MUC18 monoclonal antibodies, useful for treating a disease or condition associated with expression of MUC18 in a patient, e.g. tumors, cancers, and other malignancies.

Claim 3; SEQ ID NO 2; 78pp; English.

The invention relates to a novel isolated monoclonal antibody comprising a heavy or light chain amino acid or a heavy or light chain variable domain where the antibody binds to MUC18. The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating a disease or condition associated with the expression of MUC18 on the pancreatic or colorectal tumours, specifically melanoma, oesophageal, pancreatic or colorectal tumours, carcinomas, particularly cervical carcinomas and cervical intraepithelial neoplasia and cancers including colorectal, breast or lung cancer, as well as other malignancies. The current sequence is that of the anti-human MUC18 monoclonal antibody

N

```
The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a monoclonal antibody comprising a heavy chain amino acid, where the monoclonal antibody consists of any one of 10 fully defined sequences of 117-123 amino acids given in the specification, and where the monoclonal antibody binds MUC18, and contacting the tumour with the antibody resulting in inhibited proliferation of the cells. The monoclonal antibody has cytosteric and can be used in the production of a vaccine. The monoclonal antibodies against the MUC18 antigen are useful for diagnosing and treating tumoure, inhibiting tumour growth (e.g. melanoma, lung tumour or tumour metastesis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal having a metastetic tumour. This sequence represents an anti-MUC18 antibody light chain, variable region,

The method involves administering anti-WUC18 monoclonal antibody. The method of the invention is useful for inhibiting cell (e.g. melanoma or tumour cell) proliferation associated with the expression of MUC18 tumour antigen, the method is preferably useful for inhibiting tumour metastrasis. The method carcinomas, cancer and other malignancies. The present amino acid sequence represents a light chain from an MUC18 tumour antigen-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9

The present invention describes a method (M1) for identifying an antipatelet autoantibody (I) in a mammal. The autoantibody is detected by producing an antibody phage display library from B-lymphocytes obtained from the mammal, and screening the library to detect a phage that conducing an antibody phage of interest to detect a phage that the mammal, and screening the library to detect a phage that is pacific comportively cell-comporties panning. Also described: (I) an autoantibody identified by (M1); (2) an isolated mucleic acid encoding an anti-platelet autoantibody; (3) inhibiting (M2) blood clotting in a mammal having a thrombus formation; (4) reversibly (M3) inhibiting blood clotting in a mammal having a thrombus or at risk of thrombotic thrombocycopenic purpura in a mammal; (B) inhibiting (MN) and thrombotic thrombocycopenic purpura in a mammal; (B) inhibiting (MN) chrombotic thrombocycopenic purpura in a mammal; (B) inhibiting (MN) blatelet function; (II) inhibiting (MN) platelet autoantibody, or its biologically active fragment with a cantiplatelet autoantibody, (IS) treating (M2) applatelet autoantibody, with a platelet; (I3) a peptide that inhibiting platelet autoantibody, or its biologically active fragment that cantibody, or its biologically active fragment that comprise and inhibiting platelet activation comprising on derived from an H4414 corting inhibiting platelet aggregation, inhibiting platelet activation comprising an amount of an antiplatelet autoantibody, or its biologically active fragment that contribody, or its biologically active fragment that contribody, or its biologically active fragment that antiplatelet autoantibody, or its biologically active fragment that cantibody, or its biologically active fragment that antiplatelet autoantibody, or its biologically active fragment comprising with glycoprotein IIb/IIIa, where the autoantibody, or its biologically active fragment antiplatelet autoantibody, or its biologically active fragment antiplatelet autoantibody, or its biologically active

The anti-CD40 antibody of the invention demonstrates cytostatic, virucide, antibacterial, immunostimulant and anti-HIV activities and may be useful for treating a hyperproliferative disorder such as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody full length light chain protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    anti-CD40 monoclonal antibody; CD40; cytostatic; virucide; antibacterial; immunostimulant; anti-HIV; hyperproliferative; cancer; viral; bacterial infection; immunodeficiency; neutropenia; HIV; gene therapy;

The invention relates to a novel chimeric or human monoclonal antibody or its antigen-binding portion that specifically binds to and activates human CD40. The anti-CD40 antibody of the invention demonstrates cytostatic, virucide, antibacterial, immunostimulant and anti-HIV activities and may be useful for treating a hyperproliferative disorder souch as cancer, viral and bacterial infection or genetic, primary or combined immunodeficiency conditions including neutropenia or HIV infection. The anti-CD40 antibodies may also be useful for detecting CD40 in a biological sample in vitro or in vivo, as well as during gene therapy procedures. The current sequence is that of the human anti-CD40 antibody full length light chain protein of the invention.

The present invention describes a method (M1) for identifying an anti-

C platelet autoantibody (1) in a mammal. The autoantibody is detected by

producing an antibody phage display library from B-lymphocytes obtained

from the mammal, and screening the library to detect a phage that

c preducing an antibody phage of library to detect a phage that

c specifically binds with a platelet component, where the screening

c surface panning the phage on intact platelets using competitive cell-

c surface panning. Also described: (1) an autoantibody identified by (M1);

C (2) an isolated nucleic acid encoding an anti-platelet autoantibody; (3)

inhibiting (M2) blood clotting in a mammal having a thrombus or at risk

C (4) inhibiting of an anti-platelet autoantibody with a platelet component;

C (5) inhibiting of solatelet adhesion in a mammal; (7) treating (M7)

C (6) inhibiting (M5) platelet adhesion in a mammal; (1) reating (M7)

C (7) platelet aggregation; (9) inhibiting (M8) platelet activation; (10)

C (6) inhibiting (M3) platelet function; (11) inhibiting (M7)

C (7) platelet autoantibody, or its biologically active fragment with a conti-platelet autoantibody, (15) treating (M1) a peptide that inhibits binding of an anti-platelet autoantibody, (15) treating (M1) a peptide that inhibits binding of an anti-platelet autoantibody, or its biologically active fragment that

C platelet autoantibody, or its biologically active fragment that

C colotting, inhibiting platelet aggregation, inhibiting platelet function

C conting, inhibiting platelet aggregation, inhibiting a mammal;

C platelet autoantibody, or its biologically active fragment that

C platelet autoantibody, or its biologically active fragment that

C platelet autoantibody, or its biologically active fragment comprises an antigen binding region derived from an H414

C inhibitor of the binding with glycoprotein IIb/IIIa, where the autoantibody, the kit further comprised an applicator inhibitor of the binding with glycoprotein and an applicator inhibitor of th

The autoantibody is detected by producing an antibody phage display library from B-lymphocytes obtained from the mammal, and screening the library to detect a phage that specifically binds with a platelet component, where the screening comprises panning the phage on intact platelets using competitive cellsurface panning. Also described: (I) an autoantibody identified by (M1); (2) an isolated nucleic acid encoding an anti-platelet autoantibody; (3) inhibiting (M2) blood clotting in a mammal having a thrombus or at risk of thrombus formation; (4) reversibly (M3) inhibiting blood clotting in a mammal having a thrombus or at risk of thrombus formation; (5) inhibiting (M4) binding of an anti-platelet autoantibody with a platelet component;
and an instructions for use. (I) has haemostatic, anticoagulant and thrombolytic activities. The autoantibodies (I) are useful for diagnosing and for developing therapeutics for diseases mediated by autoantibody binding with platelet antigens. (M6) and (M12) are useful for treating thrombocytopenic purpura and idiopathic thrombocytopenic purpura and idiopathic thrombocytopenic purpura, respectively. (M2) and (M3) are useful for inhibiting blood clotting. The present sequence is used in the exemplification of the

thrombotic thrombocytopenic purpura in a mammal; (7) treating (M6) thrombotic thrombocytopenic purpura in a mammal; (8) inhibiting (M7) charelet aggregation; (9) inhibiting (M8) platelet aggregation; (10) inhibiting (M10) binding of an anti-platelet autoantibody, or its biologically active fragment with a platelet; (12) identifying (M11) a peptide that inhibiting binding of an anti-platelet autoantibody with a platelet; (13) a peptide identified by the method of (12); (14) a peptide that specifically binds with an anti-compared (17P) in a mammal; and (16) a kit for reversibly inhibiting blood clotting, inhibiting platelet activation comprising an amount of an anti-complatelet activation comprising a macunt of an anti-complatelet activations for the kit further comprising a peptide cand an instructions for use. (1) has haemostatic, anticoagulant and thrombolytic activities. The autoantibodies (1) are useful for diagnosing cand for developing therapeutics for diseases mediated by autoantibody thrombolytic activities. The autoantibodies (1) are useful for treating thrombolytic purpura, respectively. (M2) and (M12) are useful for treating thrombolytic purpura, respectively. (M2) and (M13) are useful for inhibiting blood contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               - for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents the light chain of a human antibody, and can be used in the humanised immunoglobulin of the invention. The humanised immunoglobulin reacts specifically with a region of a Pas ligand that is important in inhibiting apoptosis induced by cells with Pas expression. The immunoglobulin of the invention can inhibit applysiological reactions between a Pas ligand and Pas, typified by apoptosis. The humanised immunoglobulin is used for treatment of ADS, rejection following transplant surgery, autoimmune diseases such as SLE

The present invention describes a method (M1) for identifying an antipopate autoantibody (I) in a mammal. The autoantibody is detected by producing an antibody phage display library from B-lymphocytes obtained from the mammal, and screening the library from B-lymphocytes obtained from the mammal, and screening the library from B-lymphocytes obtained from the mammal, and screening the library from B-lymphocytes obtained from the mammal, and screening the library from B-lymphocytes obtained comprises panning the phage on intact platelets using competitive cell-caurface panning. Also described: (1) an autoantibody identified by (M1); (2) an isolated nucleic acid encoding an anti-platelet autoantibody; (3) inhibiting (M2) blood clotting in a mammal having a thrombus or at risk of thrombus formation; (5) inhibiting (M3) platelet autoantibody with a platelet component; (6) inhibiting (M5) platelet adhesion in a mammal; (8) inhibiting (M6) platelet dathesion in a mammal; (8) inhibiting (M7) platelet autoantibody, or its biologically active fragment with a platelet; (12) identifying (M1) a peptide that inhibits binding of an anti-platelet autoantibody, or its biologically active fragment with a cani-platelet autoantibody, or its biologically active fragment that coperation or inhibiting platelet aggregation; (14) a peptide that specifically binds with an anti-coplatelet autoantibody, or its biologically active fragment that coplatelet autoantibody, or its biologically active fragment that coplatelet autoantibody, or its biologically active fragment that that the fragment comprises an antigen binding region derived from an H44L4 antigenent comprises an antigen binding region derived from an H44L4 antigenent that further comprising a peptide autoantibody, the kit further comprising a peptide

Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-1R and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit
inhibitor of the binding with glycoprotein IIb/IIIa, and an applicator and an instructions for use. (I) has haemostatic, anticoagulant and thrombolytic activities. The autoantibodies (I) are useful for diagnosing and for developing therapeutics for diseases mediated by autoantibody binding with platelet antigens. (M6) and (M12) are useful for treating thrombotic thrombocytopenic purpura and idiopathic thrombocytopenic purpura and idiopathic thrombocytopenic clotting. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                             1 DIVMTQSPLSLPVTPGEPASISCRSSQSLLHSNGYNYLDMYLDWYLQKPGQSPQLLIYLGSNRA 60

The present invention describes a method (M1) for identifying an antipplated autoantibody (1) in a mammal. The autoantibody is detected by platelet autoantibody (1) in a mammal. The autoantibody is detected by producing an antibody phage display library from B-lymphocytes obtained from the mammal, and screening the library to detect a phage that specifically binds with a platelet component, where the screening comprises panning the phage on intact platelets using competitive cellsurface panning. Also described: (1) an autoantibody identified by (M1); an isolated nucleic acid encoding an anti-platelet autoantibody; (3) inhibiting (M2) blood clotting in a mammal having a thrombus or at risk of thrombus formation; (4) reversibly (M3) inhibiting blood clotting in a mammal having an anti-platelet autoantibody is inhibiting (M5) platelet adhesion in a mammal; (7) treating (M6) thrombotic thrombocytopenic purpura in a mammal; (8) inhibiting (M7)
                                                                                                                                                                                                                             ö
transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.

contributing (M9) platelet function; (11) inhibiting (M10) binding of an anti-platelet autoantibody, or its biologically active fragment with a platelet; (12) identifying (M11) a peptide that inhibits binding of an anti-platelet autoantibody with a platelet; (13) a peptide that inhibits binding of an anti-platelet autoantibody with a platelet; (13) a peptide identified by the method of (12); (14) a peptide that specifically binds with an anti-platelet autoantibody; (15) treating (M12) idiopathic thrombocytopenic purpura (ITP) in a mammal, and (16) a kit for reversibly inhibiting blood clothing, inhibiting platelet aggregation, inhibiting platelet function or inhibiting platelet activation comprising an amount of an anti-continuity inhibiting platelet activation comprising an amount of an anti-continuity inhibiting platelet activation comprising an amount of an anti-continuity platelet autoantibody, or its biologically active fragment that specifically binds with glycoprotein IIb/IIIa, where the autoantibody, or its fragment comprises an antigen binding region derived from an H4114 anti-platelet autoantibody, the kit further comprising a peptide inhibitor of the binding with glycoprotein IIb/IIIa, and an applicator of thrombolytic activities. The autoantibodies (I) are useful for developing therapeutics for diseases mediated by autoantibody thrombolytic activities. (M6) and (M12) are useful for treating thrombolic thrombocytopenic purpura and idiopathic thrombocytopenic purpura and idiopathic thrombocytopenic purpura and idiopathic thrombocytopenic purpura and idiopathic thrombocytopenic cutting. The present sequence is used in the exemplification of the

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                  1 DIVMTQSPLSLPVTPGEPAS.......CMQAQQSPITFGQGTRLEIK 112

New human anti-MUC18 monoclonal antibodies, useful for treating a disease or condition associated with expression of MUC18 in a patient, e.g. tumors, cancers, and other malignancies.

Claim 3; SEQ ID NO 6; 78pp; English.

a heavy or light chain amino acid or a heavy or light chain variable domain where the antibody binds to MUC18. The monoclonal antibody of the invention demonstrates cytostatic activity and may be useful for treating a disease or condition associated with the expression of MUC18 on the cell surface such as tumours, specifically melanoma, oesophageal, pancreatic or colorectal tumours, carcinomas, particularly cervical carcinomas and cervical intraepithal neoplasia and cancers including colorectal, breast or lung cancer, as well as other malignancies. The current sequence is that of the anti-human MUC18 monoclonal antibody comprising The invention relates to a novel isolated monoclonal antibody

The invention comprises a method for inhibiting cell proliferation associated with expression of MUC18 tumour antigen. The method involves administering anti-MUC18 monoclonal antibody. The method of the invention is useful for inhibiting cell (e.g. melanoma or tumour cell) proliferation associated with the expression of MUC18 tumour antigen, the method is preferably useful for inhibiting tumour metastesis. The method is useful for inhibiting cell proliferation in patients with tumours, carcinomas, cancer and other malignancies. The present amino acid sequence represents a light chain from an MUC18 tumour antigen-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting cell proliferation associated with expression of MUC18 tumor antigen, involves incubating and inhibiting cell by administering anti-MUC18 monoclonal antibody.

The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a monoclonal antibody comprising a heavy chain amino acid, where the antibody consists of any one of 10 fully defined sequences of 117-123 amino acids given in the specification, and where the monoclonal antibody binds MUC18, and contacting the tumour with the antibody resulting in inhibited proliferation of the cells. The monoclonal antibody has cytostatic and can be used in the production of a vaccine. The monoclonal antibodies against the MUC18 antigen are useful for diagnosing and treating tumours, inhibiting tumour growth (e.g. melanoma, lung tumour or tumour metastasis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal having a metastatic tumour. This sequence represents an anti-MUC18 antibody light chain, variable region,

The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a monoclonal antibody comprising a heavy chain amino acid, where the antibody consists of any one of 10 fully defined sequences of 117-123 amino acids given in the specification, and where the monoclonal antibody binds WUC18, and contacting the tumour with the antibody resulting in inhibited proliferation of the cells. The monoclonal antibody has cytostetic and can be used in the production of a vaccine. The monoclonal antibodies against the WUC18 antigen are useful for diagnosing and treating tumours, inhibiting tumour growth (e.g. mélanoma, lung tumour or tumour metastasis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal having a metastatic tumour. This sequence represents an anti-WUC18 antibody light chain, variable region,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            monoclonal antibody; tumour; MUC18; proliferation; cytostatic; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a heavy or light chain amino acid or a heavy or light chain variable domain where the antibody binds to WCI8. The monoclonal antibody of the invention demonstrates evrostatic activity and may be useful for treating a disease or condition associated with the expression of MUCI8 on the cell surface such as tumours, specifically melanoma, oesophageal, pancreatic or colorectal tumours, carcinomas, particularly cervical carcinomas and cervical intraepithelial neoplasia and cancers including colorectal, breast or lung cancer, as well as other malignancies. The current sequence is that of the anti-human MUCI8 monoclonal antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human anti-MUC18 monoclonal antibodies, useful for treating a disease or condition associated with expression of MUC18 in a patient, e.g. tumors, cancers, and other malignancies.
                                                                                                                                                                                                                                                                          anti-human MUC18 monoclonal antibody; heavy; light chain variable domain; cytostatic; melanoma; oesophageal; pancreatic; colorectal tumour; cervical carcinoma; intraepithelial neoplasia; colorectal; breast;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated monoclonal antibody comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EIVMTQSPATLSVSPGERATLSCRASQSVSNNLAWYQQKPGQAPRLLIYGASTRATGIPA

The invention comprises a method for inhibiting cell proliferation associated with expression of MUC18 tumour antigen. The method involves administering anti-MUC18 monoclonal antibody. The method of the invention is useful for inhibiting cell (e.g. melanoma or tumour cell) proliferation associated with the expression of MUC18 tumour antigen, the method is preferably useful for inhibiting cell for inhibiting cell proliferation in patients with tumours, carcinomas, cancer and other malignancies. The present amino acid sequence represents a light chain from an MUC18 tumour antigen-specific
                                                                                                                                                                                                                                                                                           Inhibiting cell proliferation associated with expression of MUC18 tumor antigen, involves incubating and inhibiting cell by administering anti-MUC18 monoclonal antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 BIVMTQSPATLSVSPGBRATLSCRASQSISNNFAWYQQKPGQAPRLLIFGASTRATGIPA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel monoclonal antibody used for inhibiting tumour growth in an animal. The tumour inhibition process comprises selecting an animal in need of treatment for a tumour, providing a menoclonal antibody comprising a heavy chain amino acid, where the antibody consists of any one of 10 fully defined sequences of 117-123 amino acids given in the specification, and where the monoclonal antibody binds MUC18, and contacting the tumour with the antibody resulting in chibited proliferation of the cells. The monoclonal antibody has cytosteric and can be used in the production of a vaccine. The monoclonal antibodies against the MUC18 antigen are useful for diagnosing and treating tumours, inhibiting tumour growth (e.g. melanoma, lung tumour or tumour metaerasis), inhibiting cell invasion associated with melanoma, or increasing survival of an animal having a metastatic tumour. This sequence represents an anti-MUC18 antibody light chain, variable region,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

The present invention describes a method (M1) for amplifying a nucleic acid strand. M1 comprises providing an engineered nucleic acid strand (S) acid strand. M1 comprises providing an engineered nucleic acid strand (S) having a predetermined sequence at one end and a sequence complementary to the predetermined sequence in the presence of a polymers or and nucleotides under conditions suitable for polymerisation of the nucleotides under conditions suitable for polymerisation of the nucleotides under conditions suitable for polymerisation of the nucleotides. Also described is an engineered and a sequence complementary to the predetermined sequence at the other end. M1 is useful for to the predetermined sequence at the other end. M1 is useful for complementary to the predetermined sequence at the other end. M1 is useful for products that can be used for products that can be used complementary in a susfable expression vector, where the vector can be used to transform an appropriate host organism to produce the polypeptide or protein encoded by the target sequence. M1 is useful to amplify a family of related sequences to build a complex library such as, for example an antibody library. M1 is useful not only for producing large amounts of antibody library M1 is useful not only for producing large amounts of confidered than one different target nucleic acid sequence located on the same or different nucleic acid sequence located on the same or different nucleic acid sequence and in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EIVMTQSPATLSVSPGERATLSCRASQSVSSNLAWYQQKPGQAPRLLIYGASTRATGIPA 60

The present invention describes a method (M1) for amplifying a nucleic acid strand. M1 comprises providing an engineered nucleic acid strand (S) having a predetermined sequence at one end and a sequence complementary to the predetermined sequence at the other, and contacting (S) with a primer having the predetermined sequence in the presence of a polymers concletions under conditions suitable for polymerisation of the nucleotides. Also described is an engineered nucleic acid strand (I) having a predetermined sequence at one end and a sequence complementary to the predetermined sequence at the other end. M1 is useful for amplifying a nucleic acid. M1 can be used for producing an antibody library. M1 is useful for preparing amplified products that can be used to transform an appropriate host organism to produce the polypeptide or protein encoded by the target sequence. M1 is useful to amplify a family of related sequences to build a complex library such as, for example an antibody library. M1 is useful not only for producing large amounts of antibody library. M1 is useful not only for producing large amounts of antibody library. M1 is useful not only for producing large amounts of antibody library. M1 is useful not only for producing large amounts of antibody library. M1 is useful not only for producing large amounts of antibody library uncleic acid sequence, but also for amplifying simultaneously more than one different target nucleic acid sequence.

The present invention describes a method (MI) for amplifying a nucleic acid strand. MI comprises providing an engineered nucleic acid strand (S) having a predetermined sequence at one end and a sequence complementary to the predetermined sequence in the presence of a polymers primer having the predetermined sequence in the presence of a polymers and nucleotides under conditions suitable for polymerisation of the nucleotides. Also described is an engineered nucleic acid strand (I) having a predetermined sequence at one end and a sequence complementary to the predetermined sequence at the other end. MI is useful for amplifying a nucleic acid. MI can be used for producin an antibody library. MI is useful for preparing amplified products that can be used ligated into a suitable expression vector, where the vector can be used to transform an appropriate host organism to produce the polypeptide or protein encoded by the target sequence. MI is useful to amplify a family of related sequences to build a complex library such as, for example an antibody library. MI is useful not only for producing large amounts of antibody library. MI is useful not only for producing large amounts of one target nucleic acid sequence, but also for amplifying similtaneously more than one different target nucleic acid sequence located on the same or different nucleic acid sequence acid not the exemplification of the present in the present and the present and an antibody library such as a constant and an antibody library such as a constant and a constant and a complex library such as a constant and a constant and a sequence and a sequence located on the same and and a constant and a sequence used in the exemplification of the present and an antibody library and an antibody library and an antibody library and an antibody library and a sequence used in the exemplification of the present and an antibody library and an antibody library and an antibody library and an antibody library and a sequence used in the sease
                                                                                                                                                                                                                     having predetermined sequence at one end and sequence complementary to predetermined sequence at other end, with primer having predetermined
                                                                                                                                                                                      Amplifying nucleic acid by contacting engineered nucleic acid strand
